

Online Backup Manager

Our Online Backup and Recovery Service is a complete, secure and reliable data protection solution for individuals and businesses of all sizes.

Our Online Backup and Recovery Service is a complete, secure and reliable data protection solution for individuals and businesses of all sizes. Customers can rely on proven technology and experience so they can easily backup and restore their data anytime, anywhere and from any point in time. Remove the risk of data loss and the resulting outcomes by protecting your companies most valuable asset today.

In today's data driven organizations, businesses have to deal with increasing complexity, growth of corporate data, limited IT resources, new and increasing regulatory requirements and more advanced technological threats. By taking advantage of Online backup, you can remove the risk of data loss and the resulting outcomes.

Online Backup protects your data by delivering:

- Centralized, secure and reliable 24 x 7 x 365 off-site data backup
- Military grade encryption
- Archiving data to meet regulatory and policy requirements
- Fast and easy data recovery
- Reduced backup windows
- Fully automated turn-key solution
- Improved data protection quality
- Onsite data delivery services

Data protection is a complex process with multiple steps and despite the best efforts of IT teams, a failure at any step can result in critical data loss and very costly downtime.

With Online Backup, you can reliably backup your data to our secure remote facility, archive your data to meet regulatory and internal policies, and restore your data rapidly and completely anytime, anywhere. Online Backup features:

- Volume Shadowing, Backup files even when they are exclusively open e.g. outlook.pst
- In-File Delta, Backup only changes within files
- Offline backup module
- Logout backup reminder
- Real time backup server replication
- Support both full backup and incremental backup
- Supports Windows, Mac OS X, Netware, Unix, Linux
- Backup scheduling
- ONLY STORES ENCRYPTED DATA
- Data is compressed and encrypted automatically before transmitting
- Encryption and algorithms options
- Access Backup data anytime, anywhere via client software or secure web interface
- Comprehensive backup reports delivered via email
- Customizable data retention policy
- Backup account access control

Easy to use

Out client software interface (OBM and OBL) is cleanly laid out to maximize user-friendliness, while the remote management console (OBS) is fully web-based to maximize accessibility. Furthermore, the different versions of Online Backup are designed to run on different platforms and all share the same interface design, which makes life much easier for system administrators who manage a heterogeneous environment.

Extensive Data Protection Coverage

It is a common practice to store business data on personal computers instead of on the centralized server at the work place since it is undoubtedly more convenient for users. However, such practice exposes businesses to the risks of data

loss. With Online backup, all users' desktops and notebooks can be backed up seamlessly, periodically and automatically. No backups will be missed and all important business data stays with the company.

Stable and Proven Technology

Unlike a conventional backup approach, Online Backup requires absolutely no human interaction to complete a successful backup operation. Administrators are alerted via email with the status of all backups or potential problems and changes ensuring that the correct party is notified of all backup events. Important business data will always be available and accessible whenever you need it.
